

SUBMERSIBLE PUMP PBX series

OPERATION MANUAL

- Thank you for choosing Koshin's Submersible Pump.
- This manual is prepared for safe operation of the pump.
Please carefully read and fully comprehend before use.
(Incorrect use can cause death or injury.)
- Please keep this manual handy for future reference.

ACCEPTABLE FOR INDOOR AND OUTDOOR USE

⚠ CAUTION ⚠

Before use, please make sure to read the instruction manual.
Do not operate the pump out of water or insufficient water.
The pump can not be used in explosive or flammable environments
or with flammable liquids.

⚠ WARNING ⚠

Risk of electric shock. This pump is supplied with a grounding conductor
and grounding-type attachment plug.

⚠ NOTE ⚠

This pump has been engineered for clean water use only.

⚠ LIMITATIONS ⚠

- 1) The characteristics of water to be pumped are as follows:
Temperature:5~40°C (41~104°F)
Viscosity : <5 cP
pH : 6.5~8.0
Intended for clean water use only.
- 2) This pump can be used at a maximum depth of 5 meters (16.4 feet).
- 3) The permissible fluctuation of the power supply must be within the following ranges :
Voltage : ± 10%
Frequency : ± 1%
When both Voltage and Frequency fluctuate, amount of fluctuation must be
within a half of each fluctuation ranges.
- 4) The pump can not be used in explosive or flammable environments or with
volatile liquids.

! CAUTION

1. Ground-fault circuit interrupter

For electrical shock safety, this pump must be plugged into a receptacle with GFCI capabilities.

2. Power voltage and phase requirements

Please check the specifications (voltage, frequency) of the pump by viewing the nameplate on the pump body. Never use a voltage or frequency that does not comply with the pump's specifications.

3. Usable Fluids

Never use the pump with the following fluids.

Oils, salt water, strong alkali or strong acid fluids, agrochemicals, etc.

4. Treatment of the power supply cable

a. Never lift or move the pump by pulling the power cable.

Always lift the pump by the handle or by a rope attached to the handle.

b. Select an extension cord of the appropriate gauge to use with the pump.

Do not use an extension cord in water.

5. If a person is in the water where the pump is submerged, never start the pump.

6. The appliance is not to be used by persons (including children) with reduced physical, sensory or mental capabilities, or lack of experience and knowledge, unless they have been given supervision or instruction.

7. Children being supervised not to play with the appliance.

8. This appliance can be used by children aged from 8 years and above and persons with reduced physical, sensory or mental capabilities or lack of experience and knowledge if they have been given supervision or instruction concerning use of the appliance in a safe way and understand the hazards involved.

9. Children shall not play with the appliance.

10. Cleaning and user maintenance shall not be made by children without supervision.

! CAUTION

This pump uses an oil bathed double mechanical seal.

When it is necessary to assemble the mechanical seal, refer to Fig. 1.

INSTALLATION AND USE

- This pump has a thermal protector.

INSTRUCTIONS FOR USE

1. Connect the power cord to the electric source

Pay close attention, in particular, to frequency and voltage can cause decreased performance and premature wear and failure.

2. Earth leakage breaker and earthing

Be sure to ground the earthing wire before connecting the cabtyre cable to the power source.

The green wire is for earthing. Be sure to attach the leakage breaker to prevent any possible leakage trouble.

3. Place to use

The pump can be used at almost all places but avoid continuous low-water operation in a sandy place, as such may accelerate wear of the pump.

Install the pump where water can be collected easily.

When the pump is installed on soft, muddy or sandy ground, lay wooden board or block under the pump body to prevent the pump from setting.

Do not place the pump in the water if a human is in it. Severe electrical shock or death can occur.

Fig. 1

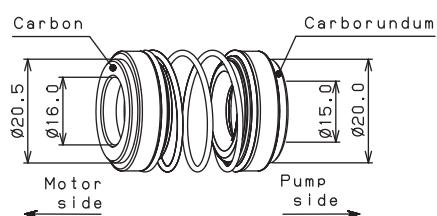

Fig. 2

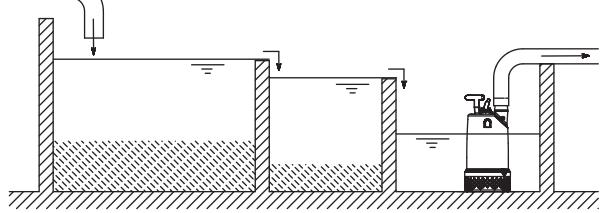

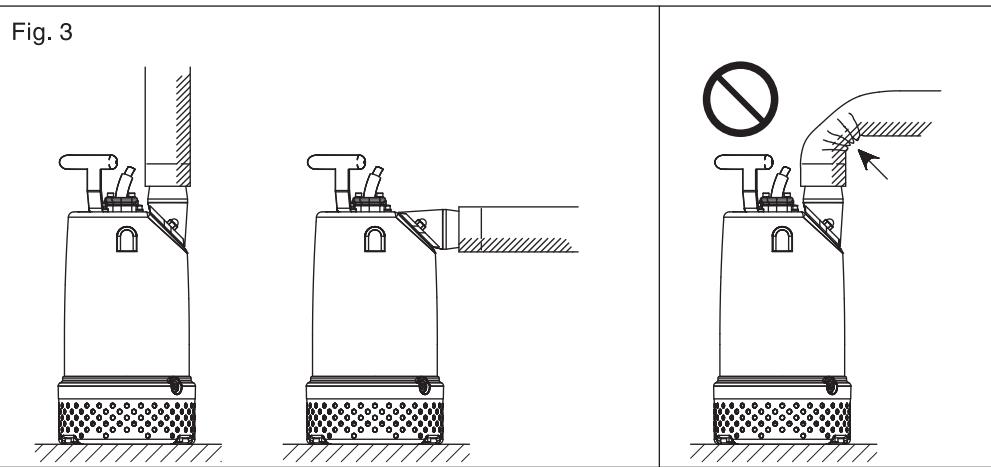

Fig. 2 shows an example of an installation method for reducing the chance of intaking sediment.

4. Hose piping

When any hose is used for connection, keep the hose as straight as possible, bends or kinks in hoses will reduce water flow, and can cause premature wear or failure of the pump.
quantity. fig.3

Do not allow discharge port to be submersed. Inverse flow may be resulted due to siphoning effect.

5. Power cable

To transfer the pump or to install, hold the pump by the handle or by a rope tied to the handle.

If the power cable is pulled instead of the rope, the core wires may break.

Do not place connection joints to extension cords under water.

6. Thermal protector

The pump incorporates a thermal protector to protect the motor, and the motor stops automatically in an over-load operation.

7. Operation of the air valve

This pump is equipped with air valves.

The air valves prevent air lock when pumping air and effectively expels heat.

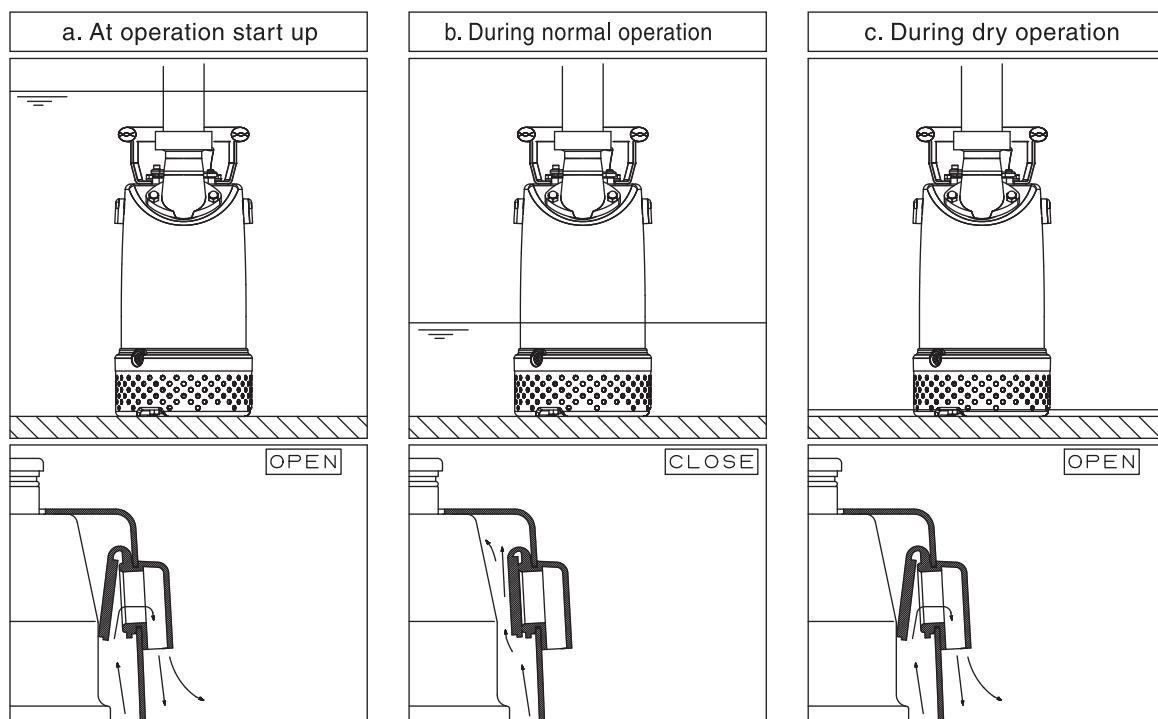

CAUTION!

If debris, etc., becomes stuck in the valve, the air valve may not operate correctly.

Check that there is no foreign matter in the valve before installing and operating the pump.

Operation of the cooling value

Fig. 4

AFTER USING PUMP

It is recommended after every use, to clean out the strainer, to protect debris lock up on next use.

1. **In cold climates, do not allow pump to freeze.**
Remove pump from water to prevent damage due to freezing.
2. **Completely drain and dry pump of water before storing.**

OPTIONAL COMPONENTS (SOLD SEPARATELY)

Float switch

This pump can have a float switch installed as an optional component.

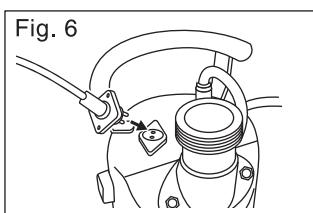

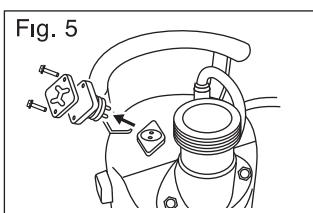

Tools required for attachment operation

- Hexagonal wrench (4 mm)

Attachment of the float switch

Follow the directions below to attach the float switch.

1. Check that the power supply cord is not plugged in, and the pump is dry before attaching float switch.
2. Loosen the bolts securing the float cap (M5 X 2) and remove the float cap. fig. 5
3. Insert the float switch into the terminal opening on the pump side, aligning the pins and pressing. (Neither of the two pins has polarity.) fig. 6

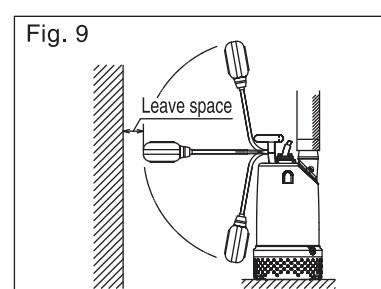

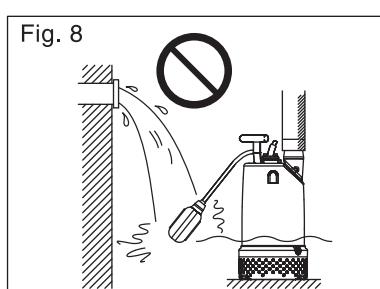

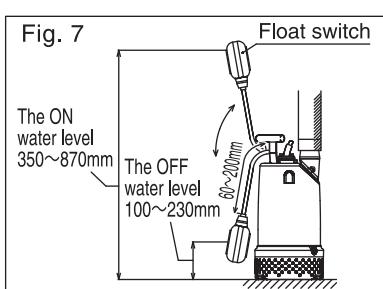

4. Use the bolts for securing the float cap to secure the float switch to the pump side.
Tightening torque: 3.0 N · m
5. Check that the float switch attachment surface is attached firmly to the pump side without any gaps.
CAUTION: If there is a gap, water will enter through it, leading to a short-circuit or pump failure.
6. Connect the power once before immersing the pump to check the float switch is operating properly.

Movement of the float switch

1. The pump with a float switch works under an automatic surface control system.

2. The pump starts automatically when the water level rises and the float comes up to the ON water level, and stops automatically when the water level falls and the float comes down to the OFF water level.
The ON and OFF water levels can be adjusted by loosening the cord band bolt.
However, the length of the cord between the cord band and the float switch should be between 60mm and 200mm, otherwise the float switch will not operate normally. fig. 7
3. The pump should not be installed where water is discharged directly on to the float. fig. 8
4. The float switch should be installed where it does not come into contact with walls or is any other obstructions. fig. 9

MAINTENANCE

1. The liquid paraffin(fig.10-12)

WARNING: BECAUSE THIS PUMP IS EQUIPPED WITH AN AUTOMATIC RE-SETTING OVERLOAD,
IT MUST ALWAYS BE DISCONNECTED FROM ITS POWER SUPPLY BEFORE HANDLING.

The liquid paraffin should be checked every 1,000 Hrs (or three months) and replaced every 2,000 Hrs (or six months).
Change the liquid paraffin and the shaft seal (an article of consumption) when the liquid paraffin contains too much
water, separated water, i.e. heavily emulsified (milky looking)

Fill with 0.28 liters (9.47 oz) of liquid paraffin.

Fig.10

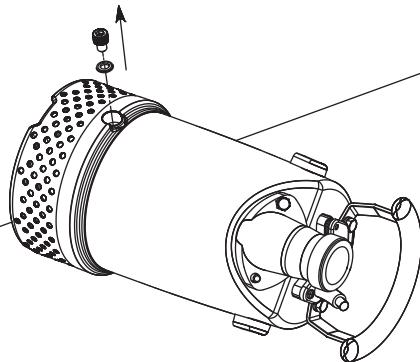

Fig.11

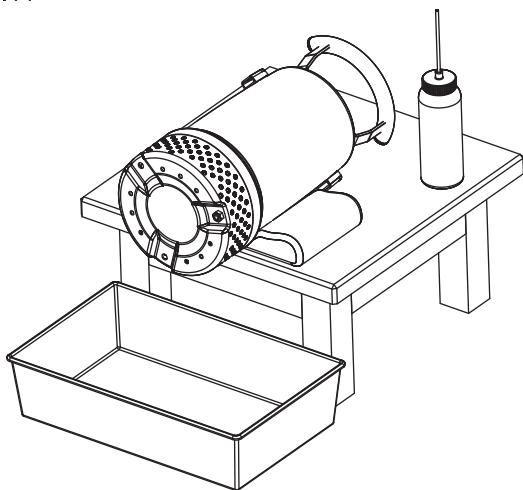

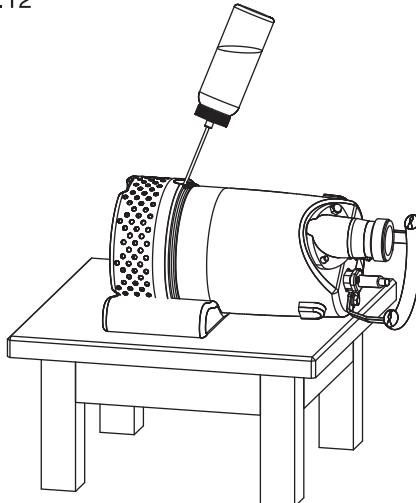

Fig.12

2. Insulation check

Motor's insulation resistance check should be examined once a month.

Using a 500V tester, the OHM (Ω) resistance between phases as well as between phase and ground should be as follows:

Above $20M\Omega$: Satisfactory.

$1\sim20M\Omega$: Capable of running, but check the power cable and the motor as early as possible.

Below $1M\Omega$: Unsatisfactory - needs service.

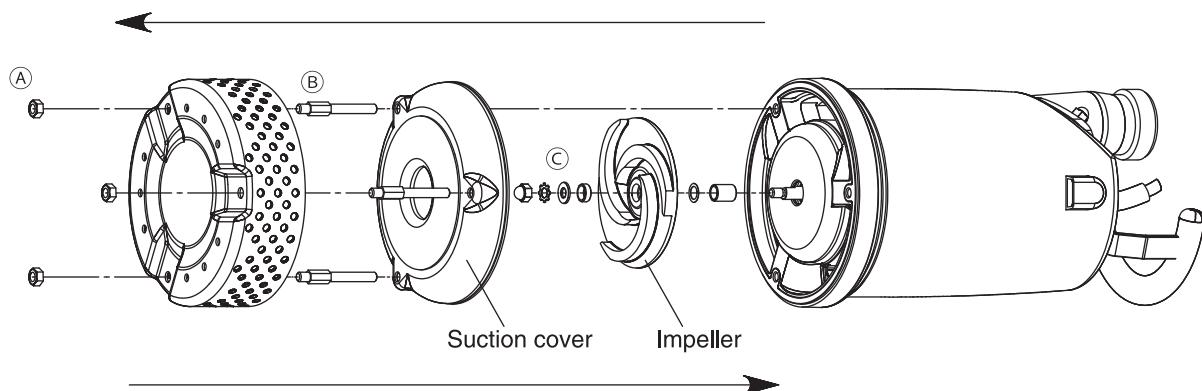

3. Replacement of the impeller

Replace the impeller if it is worn or broken.

Be sure to disconnect the power supply and render the pump inoperable before starting impeller replacement.

Please refer to Fig. 13 for the replacement procedure.

Fig.13

*When replacing the impeller, provide a gap of around 1.5 mm between the suction cover and the impeller end surface.

(Prevent contact between the impeller and the suction cover)

Tightening torque (N · m)	
(A)	15 N · m
(B)	15 N · m
(C)	5 N · m

4. Replacement of the cable

Replace the cable if it is worn or broken.

However, the user cannot change it.

Please contact our service.

TROUBLE SHOOTING

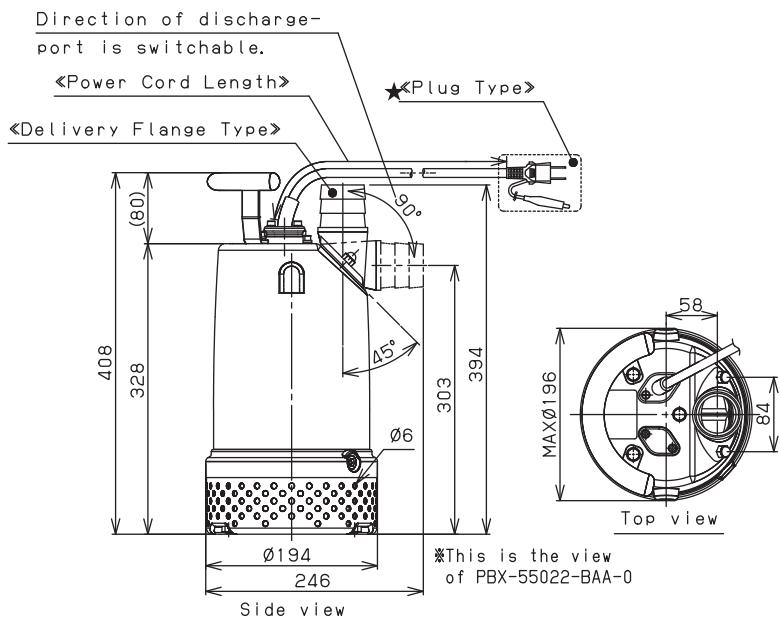

Trouble	Cause	Countermeasure
• The pump does not run.	<ul style="list-style-type: none"> • Power fuse is blown or circuit breaker tripped. • Voltage drop. • Poor connection of electric wiring. (Loose wires) • The motor is burned or the motor's insulation is questionable. • The impeller is choked with foreign debris. • The impeller is locked. • The motor's capacitor is blown. 	<ul style="list-style-type: none"> • Check fuse and replace if needed or reset circuit breaker. • Ask the power company to check. • Check the contact condition of wiring and tighten. • Replace the motor. • Clean strainer, impeller and provide with screen, collector or catcher outside of the pump's strainer. • Check the clearance of the impeller and adjust to the correct clearance. • Check the power supply and replace the capacitor.
• The pump capacity is lowered.	<ul style="list-style-type: none"> • Pump snorkeling. • Pump is clogged. • The impeller is worn. • The total pumping head is too high. 	<ul style="list-style-type: none"> • Raise the pumping water level. • Clean strainer, impeller and provide with screen, collector or catcher outside of the pump's strainer. • Replace the impeller. • Review the selection of the pump and piping.
• The pump runs, but no water is discharged.	<ul style="list-style-type: none"> • The delivery hose is folded and choked. • The total pumping head is too high. 	<ul style="list-style-type: none"> • Straighten the delivery hose. • Review the selection of the pump and piping.
• The air valve does not close. (Water continues to come out of the air valve)	<ul style="list-style-type: none"> • Foreign debris is stuck in the air valve. • Pump is snoring. 	<ul style="list-style-type: none"> • Clean the valve part. • Raise the pumping water level.
• The pump repeatedly starts/stops.(short cycles)	• The impeller is choked with foreign debris and overloaded.	• Clean strainer, impeller and provide with screen, collector or catcher outside of the pump's strainer.
